# **Bioinformatics** session

A two-day workshop for bioinformaticians and molecular biologists with focus on the TSO500 pipeline in InPreD

https://inpred.github.io/24-03\_bioinfo\_ws/

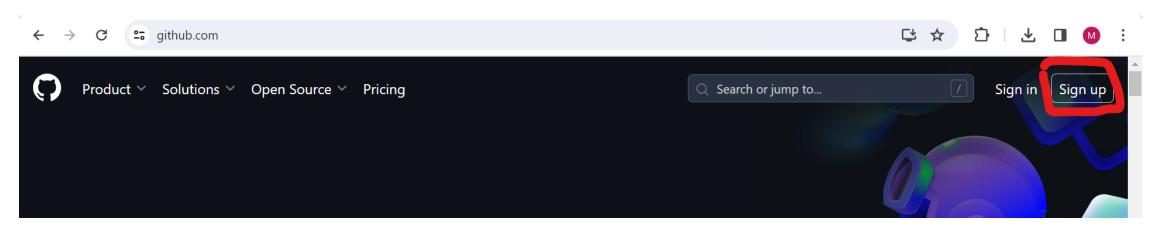

# **Overview**

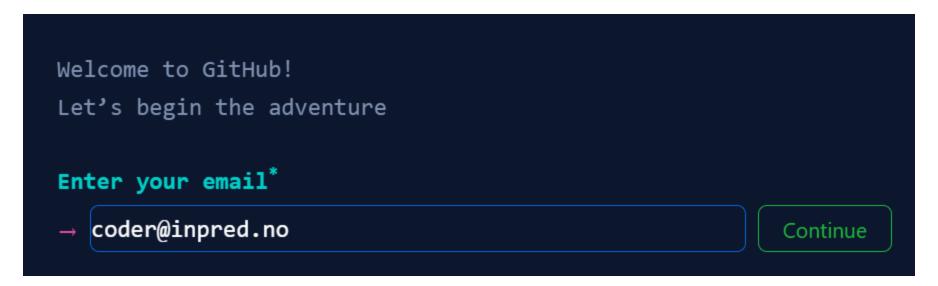

- 1. Setup
- 2. Development & Collaboration
- 3. Nextflow
- 4. tso500\_nxf\_workflow
- 5. Python

# 1. Setup

• go to https://github.com/ and click on Sign up

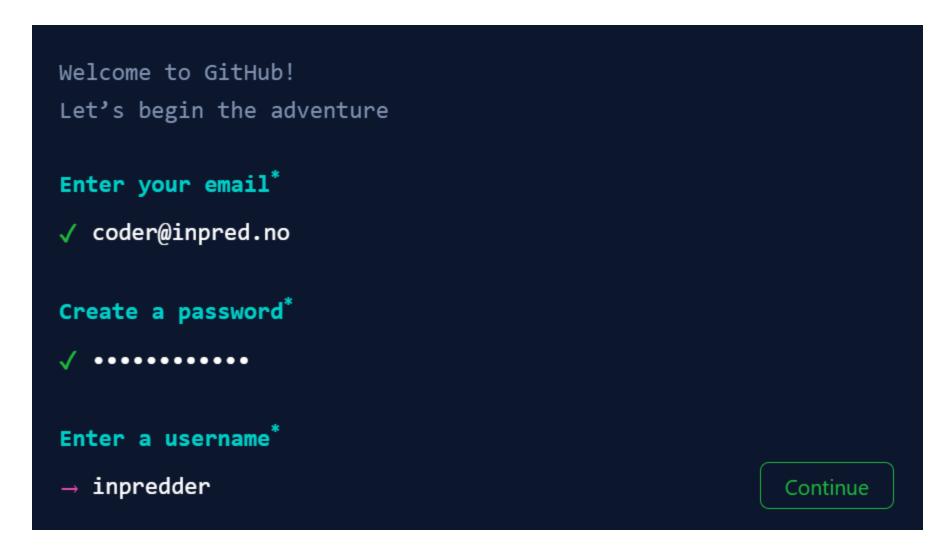

• enter your email

• set a password

```
Welcome to GitHub!
Let's begin the adventure
Enter your email*
  coder@inpred.no
Create a password*
                                                         Continue
```

• choose a username

• choose email preferences

• solve the puzzle

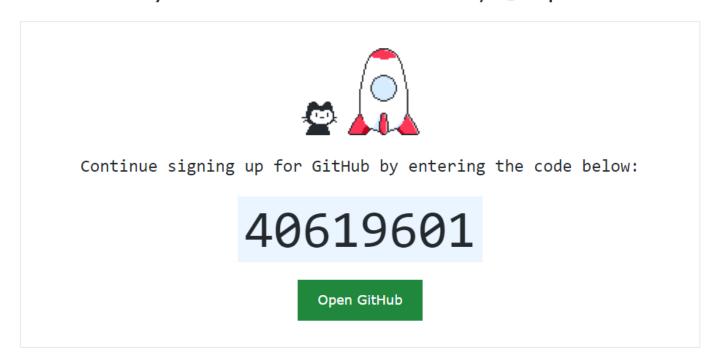

• create your account

find the activation code in the email you received

Here's your GitHub launch code, @inpredder!

select the desired options

This will help us guide you to the tools that are best suited for your projects. How many team members will be working with you? Just me O 2-5 5-10 0 10-20 20-50 50+ Are you a student or teacher? O N/A Student Teacher Continue

# What specific features are you interested in using?

Select all that apply so we can point you to the right GitHub plan.

Collaborative coding

Codespaces, Pull requests, Notifications, Code review, Code review assignments, Code owners, Draft pull requests, Protected branches, and more.

Automation and CI/CD

Actions, Packages, APIs, GitHub Pages, GitHub Marketplace, Webhooks, Hosted runners, Self-hosted runners, Secrets management, and more.

Security

Private repos, 2FA, Required reviews, Required status checks, Code scanning, Secret scanning, Dependency graph, Dependabot alerts, and more.

• choose the free plan

# 1.3. Resources

• Getting started with your GitHub account

2. Development & Collaboration

# 2.1. Short git introduction

- distributed version control system
- tracks history of changes committed by different contributors
- every developer has full copy of project and its history

# 2.1.1 git config

```
git config --global user.name <your name>
git config --global user.email <your email>
```

#### 2.1.2. Basic git commands

```
git init : initialises new git repository
git clone <repository url> : creates local copy of remote repository
git add <file/s> : stage new or changed files (anything that should be committed to the repository)
```

git commit -m "feat: my new feature" : commit changes to the repository

#### 2.1.2.1. commit message conventions

```
<type>[optional scope]: <description>
```

- feat : new feature
- fix : patching bug
- refactor: code change that neither is neither feat nor fix
- build : build system related changes
- perf: improving performance

# 2.1.2.1. commit message conventions

```
<type>[optional scope]: <description>
```

- chore : code unrelated changes, e.g. dependencies
- style : code change that does not change meaning
- test : changes to tests
- docs : adding/updating documentation
- ci : continuous integration, e.g. github actions

# 2.1.2. Basic git commands

git status: overview over untracked, modified and staged changes

git branch: show local branches

git merge: merge branches

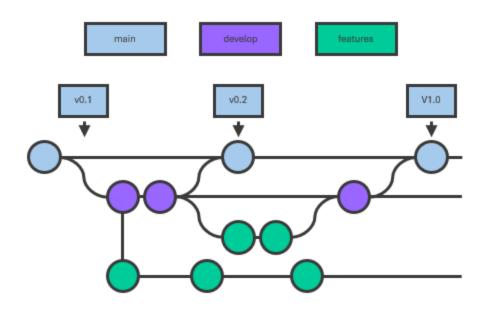

git pull: load changes from remote counterpart

git push: upload changes to remote counterpart

# 2.2. Branching model: simplied Gitflow workflow

- start with two branches to record project history: main and develop
- each new feature resides in its own branch (feature branch)
- feature branch is generally created off latest develop commit
- upon feature completion, feature branch is merged into develop
- whenever you are ready to release, merge develop into main and tag it

# 2.2. Branching model: simplied Gitflow workflow

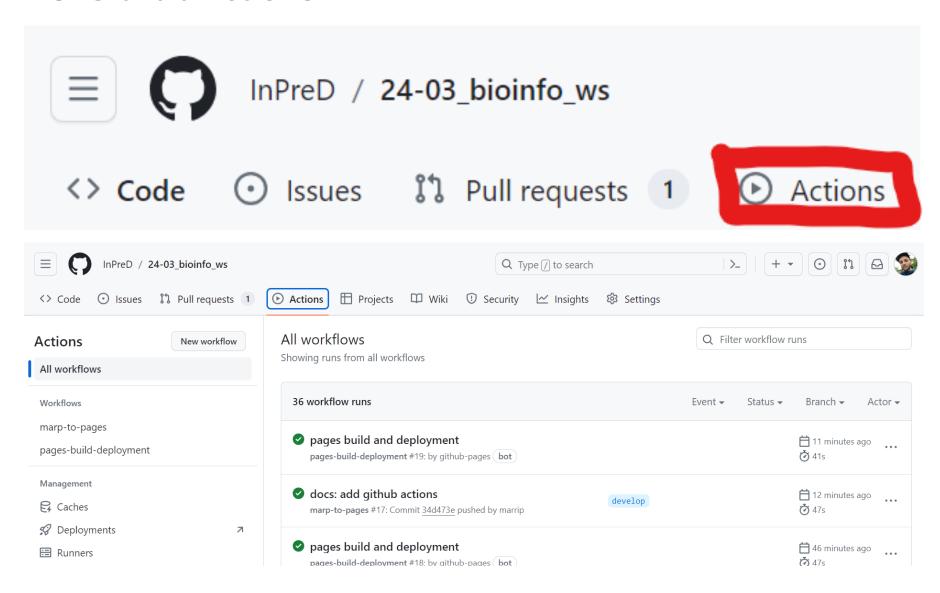

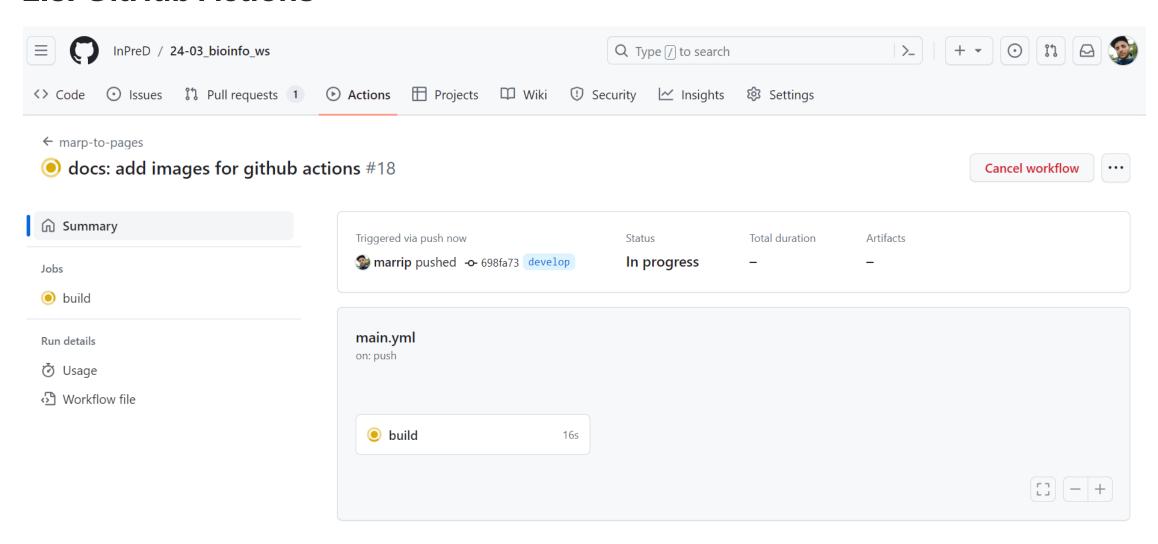

- continuous integration (CI) and continuous deployment (CD)
- building, testing and deploying directly from GitHub
- set up by adding yaml instructions to .github/workflows

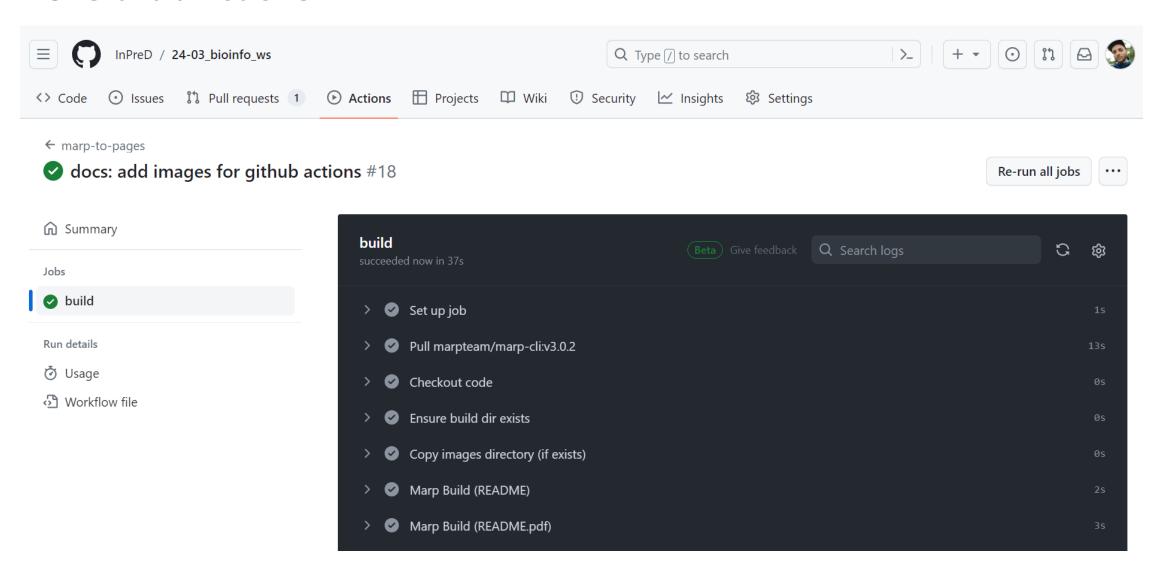

```
name: GitHub Actions Demo
on: [push]
jobs:
    Explore-GitHub-Actions:
    runs-on: ubuntu-latest
    steps:
    - run: echo "Hello world!"
```

```
name: Docker Build
on:
  push:
    branches:
      - main
      develop
    tags:
      _ '* * * * !
jobs:
  test:
    name: Run unit tests
    runs-on: ubuntu-latest
    steps:
        name: Check out the repo
        uses: actions/checkout@v4
        name: Unit testing
        uses: fylein/python-pytest-github-action@v2
        with:
          args: pip3 install -r requirements.txt && pytest
  . . .
```

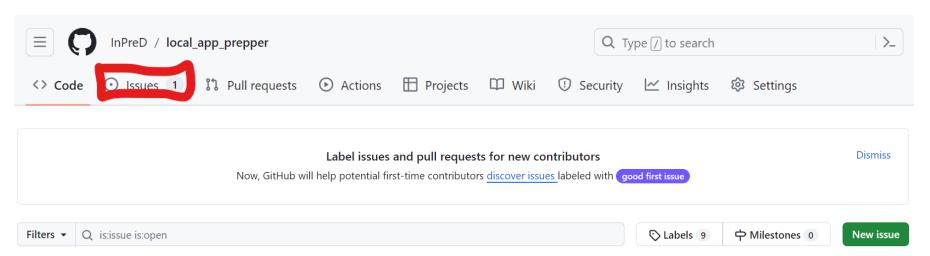

```
build:
 name: Build Image
  runs-on: ubuntu-latest
  needs: test
  steps:
     name: Check out the repo
      uses: actions/checkout@v4
      name: Lint Dockerfile
      uses: hadolint/hadolint-action@v3.1.0
      name: Docker Meta
      id: meta
      uses: docker/metadata-action@v5
      with:
       images: |
          inpred/local_app_prepper
        tags: |
          latest
          type=semver, pattern={{version}}
          type=semver,pattern={{major}}.{{minor}}
          type=semver, pattern={{major}}
      name: Login to Dockerhub
      uses: docker/login-action@v3
      with:
        username: ${{ secrets.DOCKERHUB_USERNAME }}
        password: ${{ secrets.DOCKERHUB_TOKEN }}
      name: Build and push image to Docker Hub
      uses: docker/build-push-action@v5
      with:
        push: true
        tags: ${{ steps.meta.outputs.tags }}
        labels: ${{ steps.meta.outputs.labels }}
```

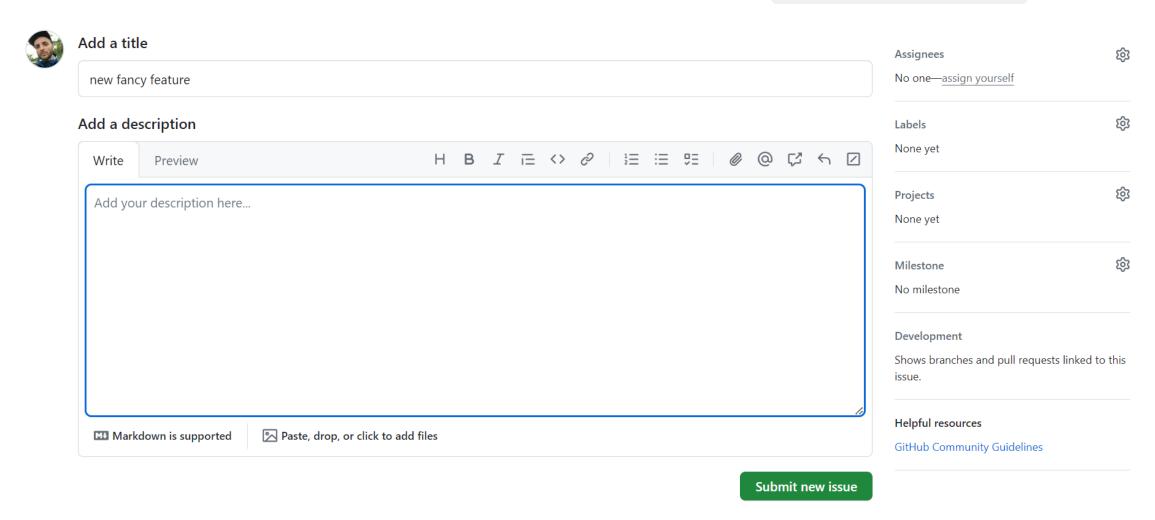

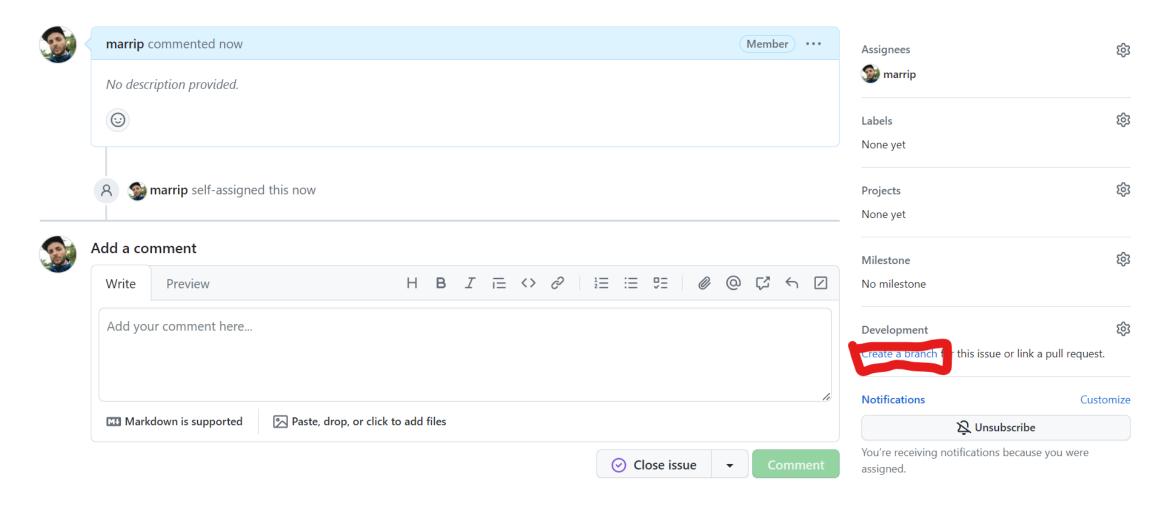

• go to issues and create a New issue

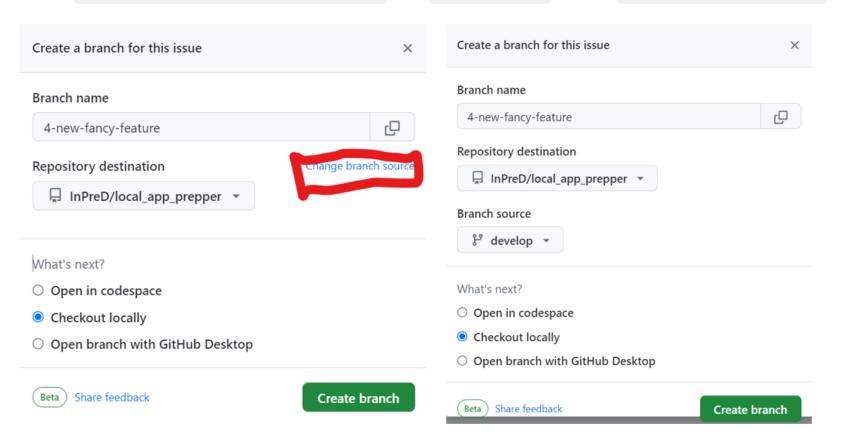

• give the issue a descriptive title and a description and Submit new issue

• if you decide to work on the issue (own repository), Create a branch via the issue

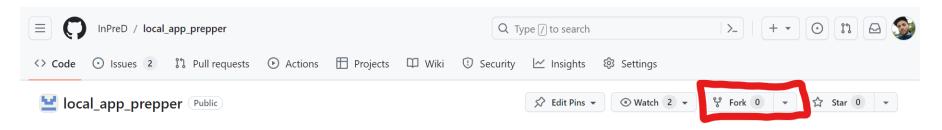

• Change branch source to develop and Create branch

- load the new branch to your local repository, check it out and start working
- push your changes back to the remote

```
$ git pull
$ git checkout 4-new-fancy-feature
$ git add README.md
$ git commit -m "docs: updating docs"
$ git push
```

• for repositories you don't have access to, create a fork

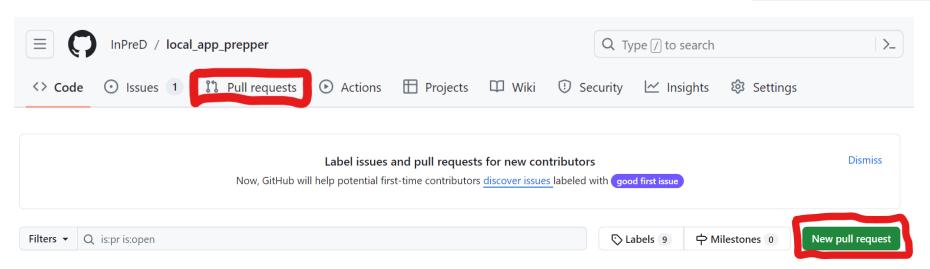

#### Create a new fork A fork is a copy of a repository. Forking a repository allows you to freely experiment with changes without affecting the original project. Required fields are marked with an asterisk (\*). Repository name \* Owner \* marrip - / local\_app\_prepper ❷ local\_app\_prepper is available. By default, forks are named the same as their upstream repository. You can customize the name to distinguish it Description (optional) creates inputs.json files to be used with the LocalApp opy the main branch only ntribute back to InPreD/local\_app\_prepper by adding your own branch. Learn more. 3 You are creating a fork in your personal account.

- once you have a fork, git clone your forked repository
- create a new branch and work on that
- git push your changes back to the forked remote

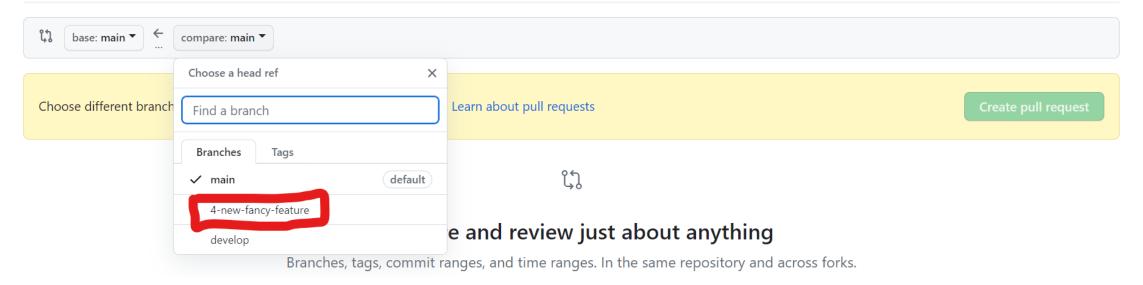

• when you are done, go to pull requests and create a New pull request

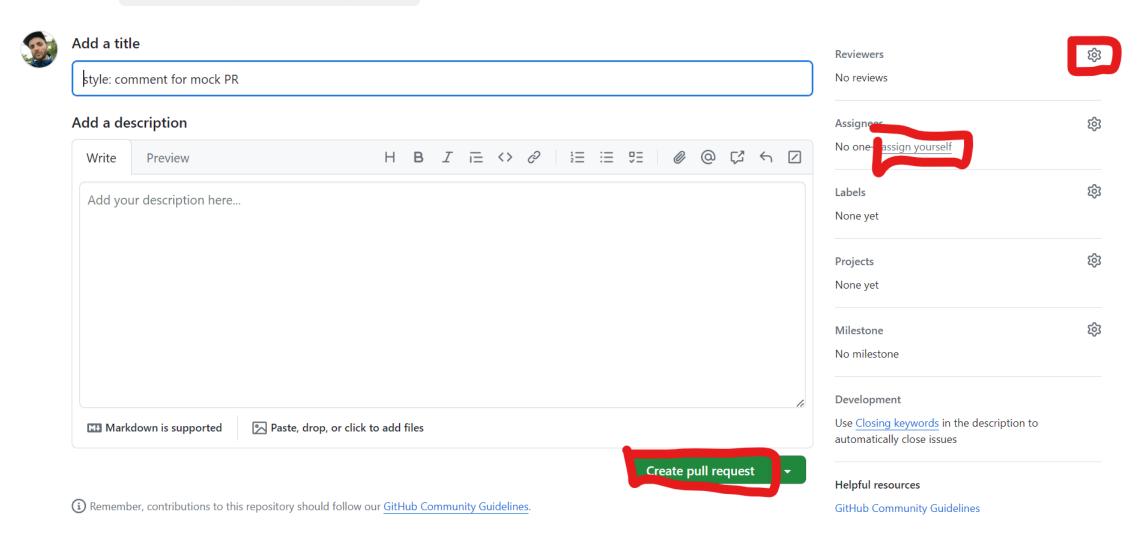

• choose develop as base and your new feature branch (same repo or forked) for compare

#### Compare changes

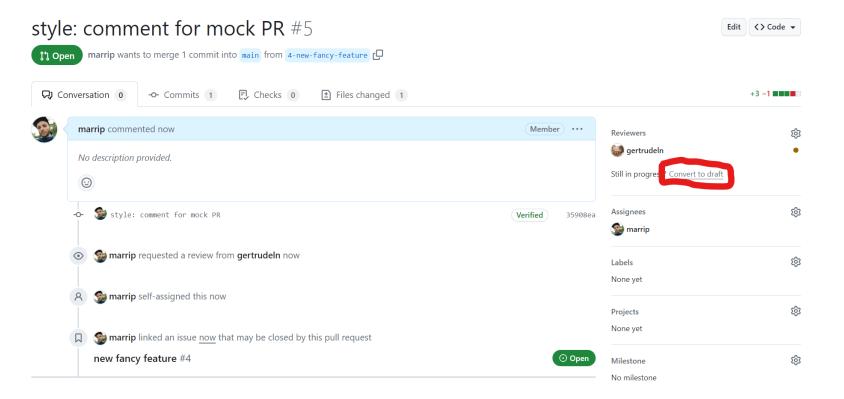

Compare changes across branches, commits, tags, and more below. If you need to, you can also compare across forks.

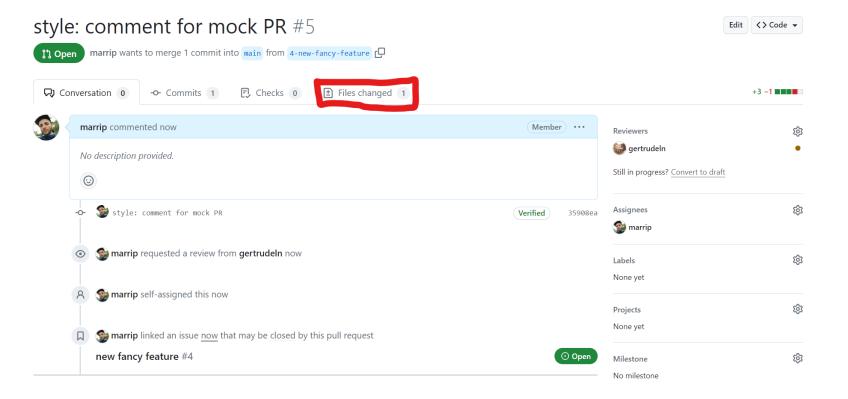

• assign yourself, add at least one reviewer (cog icon), provide some context and Create pull request

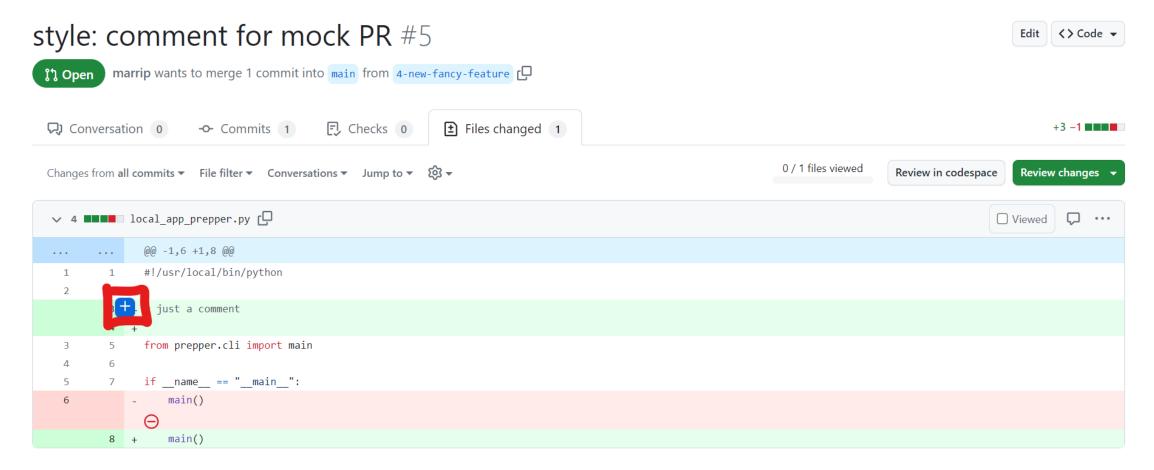

- if you still want to work on the pull request, you can Convert to draft to let the reviewers know that it is not done yet
- otherwise you can just wait for them to review your changes

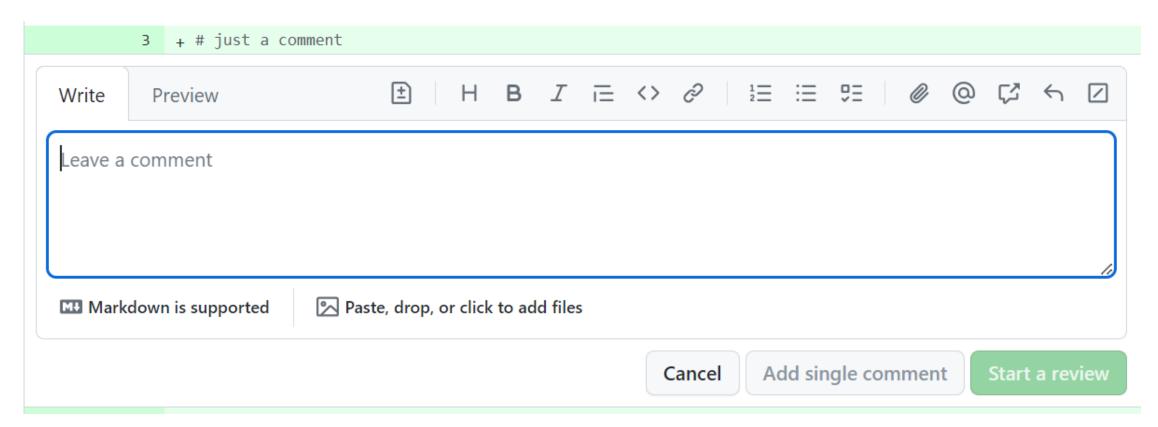

- as a reviewer, make your you check your email notifications to see if there is pull requests waiting for you
- open the pull request and start the review in the Files changed tab

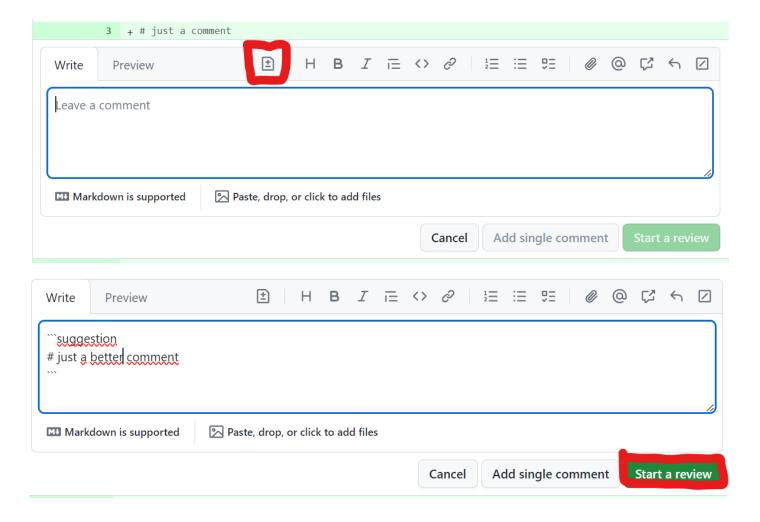

you can leave comments and suggestions in the code by hovering over the line
 with the changes and clicking on +

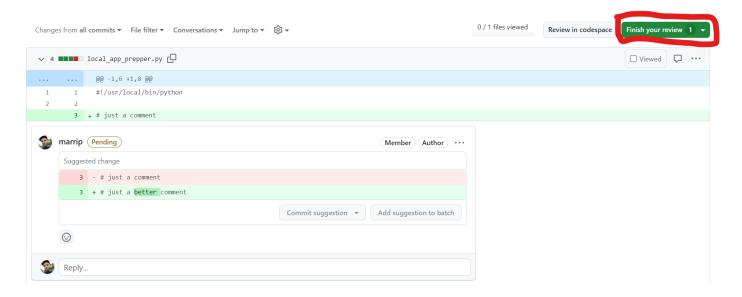

• you can type your comment

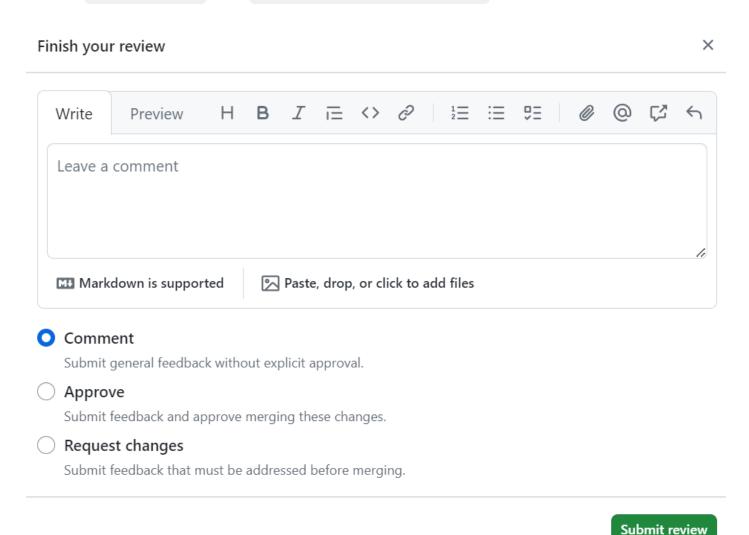

• or you leave a suggestion, ideally you click Start a review to initialise the reviewing process

• when you are done with reviewing, Finish your review

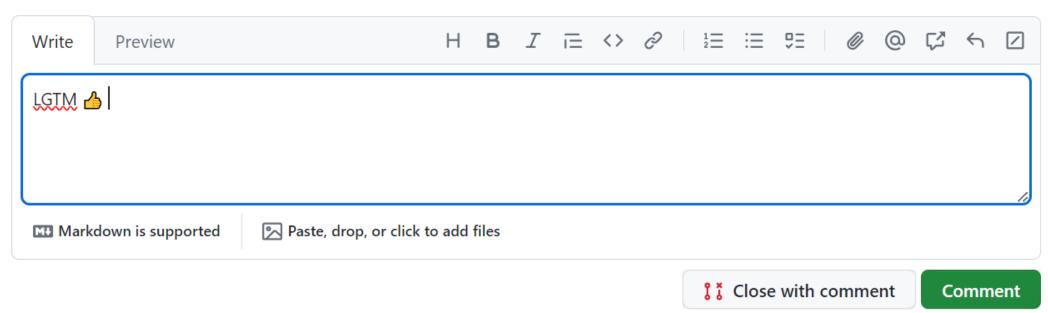

again, leave a comment if you like, and choose if you just want to Comment ,
 Approve or Request changes

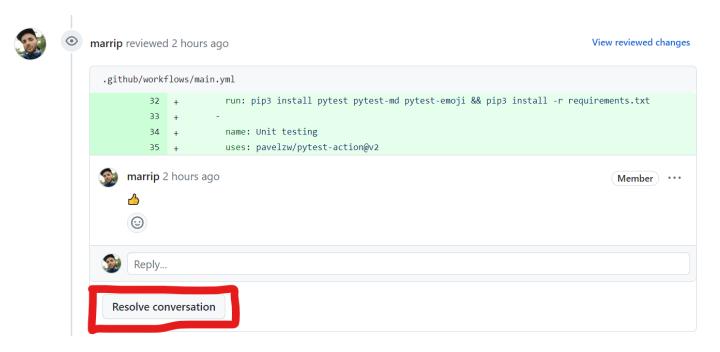

• you can add a general comment to the pull request under conversation

#### Add a comment

- after the reviewer left their comments and suggestions, you can address them one by one by replying or applying the suggested changes
- whenever a certain comment/suggestion is handled (discussion comes to conclusion, suggestion was applied), you can resolve it

• as soon as the reviewers gave you an approval, you can finally Merge pull request

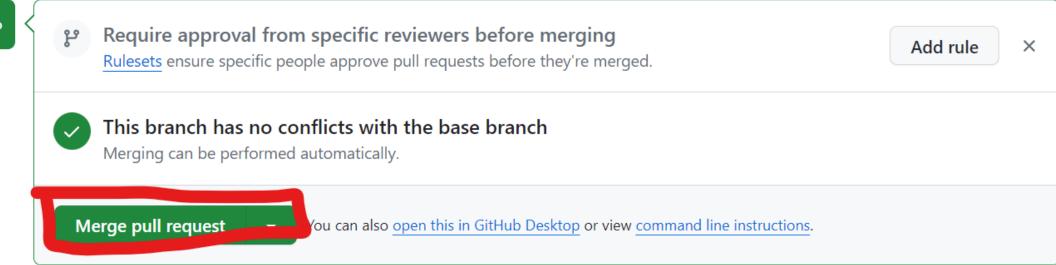

gertrudeln approved these changes 1 minute ago

View reviewed changes

Add more commits by pushing to the 4-new-fancy-feature branch on InPreD/local\_app\_prepper.

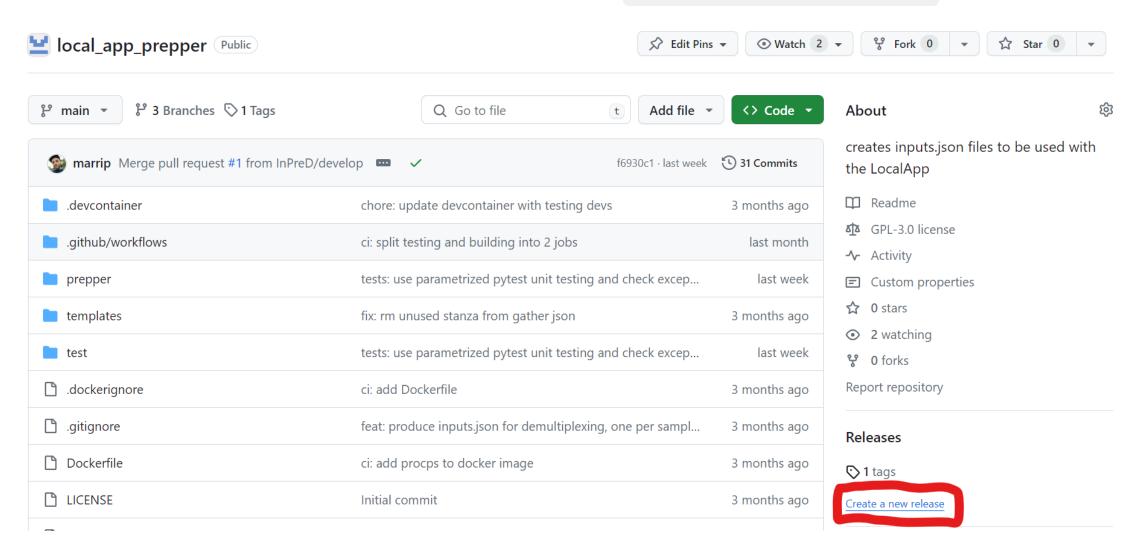

## 2.4.1 Hands-on pull request

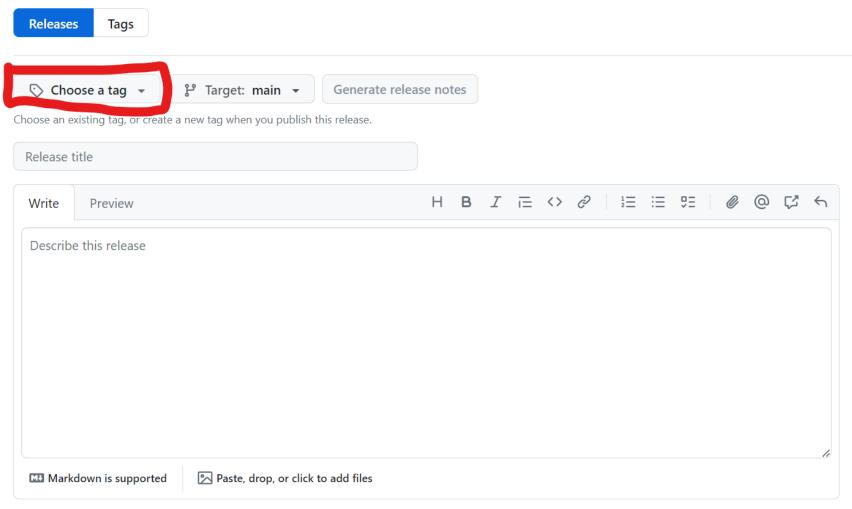

- go to https://github.com/InPreD/24-03\_bioinfo\_ws/
- create fork to your own account
- open an issue "test pull request" or similar and create a branch
- go to the branch and add a markdown file with your first name and favorite emoji to the participants folder, ideally the file is named <your first name>.md
- open a pull request in the original repository and add someone else in the group to review your pull request
- review someone else's pull request, give feedback and approve if correct

- releases should be from main branch
- good practice is to open a pull request for develop into main when you are done with the desired features

• whenever you are ready for a new release, create a new release

• add a title and a description for your release and Choose a tag

#### **Tagging suggestions**

It's common practice to prefix your version names with the letter v. Some good tag names might be v1.0.0 or v2.3.4.

If the tag isn't meant for production use, add a pre-release version after the version name. Some good pre-release versions might be v0.2.0-alpha or v5.9-beta.3.

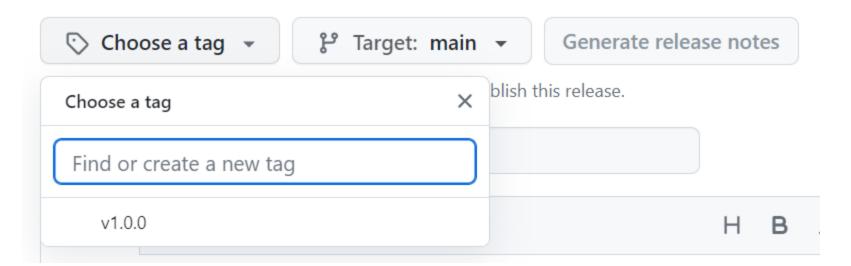

#### Semantic versioning

If you're new to releasing software, we highly recommend to <u>learn more about</u> semantic versioning.

A newly published release will automatically be labeled as the latest release for this repository.

If 'Set as the latest release' is unchecked, the latest release will be determined by higher semantic version and creation date. <u>Learn</u> more about release settings.

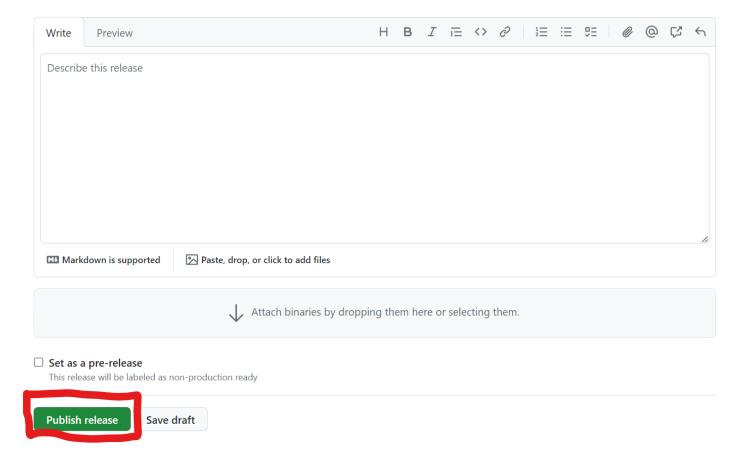

• ideally, you choose a tag according to semantic versioning

## 2.5.1. Semantic versioning

- version tag should be MAJOR.MINOR.PATCH
- you increment one of the three depending on the change
  - MAJOR: version when you make incompatible API changes
  - MINOR: version when you add functionality in a backward compatible manner
  - PATCH: version when you make backward compatible bug fixes

• when you are satisfied with your release, Publish release

## 2.6. Licensing

• let's discuss

Use the license preferred by the community you're contributing to or depending on. Your project will fit right in.

If you have a dependency that doesn't have a license, ask its maintainers to **add a**license.

The MIT License is short and to the point. It lets people do almost anything they want with your project, like making and distributing closed source versions.

Babel, .NET, and Rails use the MIT License.

# I care about sharing improvements.

The **GNU GPLv3** also lets people do almost anything they want with your project, *except* distributing closed source versions.

Ansible, Bash, and GIMP use the GNU GPLv3.

## 2.7. Resources

- About Git
- Gitflow workflow
- GitHub Actions
- Semantic versioning
- Licensing

## 3. Nextflow

#### 3.1. Short introduction

- workflow manager that enables scalable and reproducible scientific workflows using software containers
- an extension of groovy which is object-oriented programming language for the Java platform
- can be used with an array of executors, such as SLURM, k8s, AWS, Azure, Google Cloud and many more
- **nf-core**: project/community that develops framework for nextflow including guidelines, tools, modules, subworkflows, pipelines and test data

## 3.2. Requirements

- POSIX compatible system (e.g. Linux, Os X)
- Bash
- Java ≥ 11 / ≤ 21
- Docker/Singularity

## 3.3. Installation

```
$ curl -s https://get.nextflow.io | bash
$ chmod +x nextflow
```

or

\$ wget -0 nextflow https://github.com/nextflow-io/nextflow/releases/download/v23.10.1/nextflow-23.10.1-all

or via browser at https://github.com/nextflow-io/nextflow/releases

## 3.4. Best pratice: nf-core template

```
workflow_repo
 — LICENSE
  README.md
 — assets
    — mock.genome.fasta
    — samplesheet.csv
    __ schema_input.json
  – bin
    └─ script.py
  - conf
    ├─ base.config
     — modules.config
    └─ test_stub.config
  - lib
    ├─ NfcoreSchema.groovy
    — NfcoreTemplate.groovy
     — WorkflowMain.groovy
    ___ nfcore_external_java_deps.jar

               └─ meta.yml
          - custom
           — main.nf
                — meta.yml
               — templates
                  └─ dumpsoftwareversions.py
  - modules.json
  nextflow.config
  - nextflow_schema.json
  workflows
   └─ main.nf
```

## **3.6 Resources**

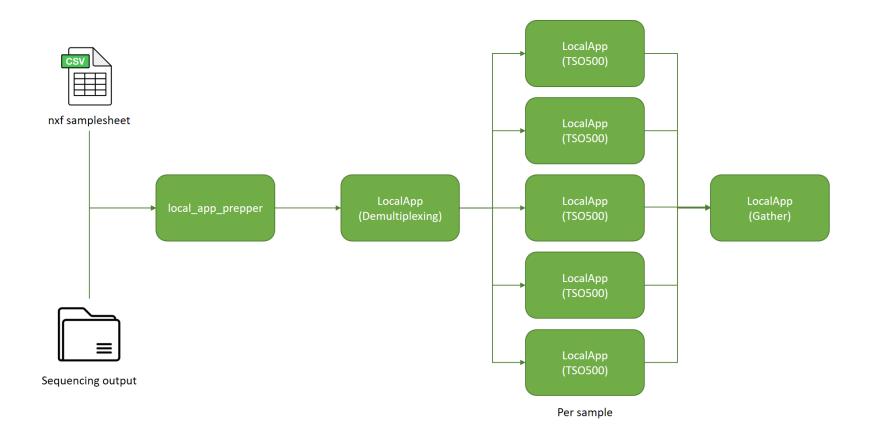

- nextflow.io
- nf-co.re
- nf-core github

4. tso500\_nxf\_workflow

## 4.1. Status update

- modified nf-core template (removed unnecessary functionality, config and metadata files)
- added devcontainer to have controlled environment (dind and sind available)
- stubbing data available
- containing three modules so far (localapp\_prepper, LocalApp, dumpsoftwareversions)
- using nf-validation plugin

## 4.2. Overview

## 4.3. Demonstration

## 4.4. Outlook

- samplesheet\_generator
- tsoppi (requires some restructuring)
- PRONTO
- include configuration files for each node
- Documentation

## 4.5. Resources

- repository
- local\_app\_prepper
- samplesheet\_generator

# 5. Python project

## **5.1.** Repository structure

- consistency/standard
- keep main script short and sweet functionality in modules

```
#!/usr/local/bin/python
from my_module import main
if __name__ == "__main__":
    main()
```

## **5.1.** Repository structure

- module folder should contain \_\_init\_\_.py
- keep functions short and try to refactor big functions
- leave descriptive comments in code
- use libraries to make your life easier
  - o pandas : csv/tsv files
  - click or argparse : define cli input flags
- introduce proper exception handling
- logging with log levels

## 5.1.1. Unit testing

- pytest for testing
- include unit tests for functions, preferable table-driven

```
def addition(x, y):
   return x+y
```

```
import pytest
@pytest.mark.parametrize("x, y, z", [(1, 1, 2), (1, -1, 0)])
def test_eval(x, y, z):
    assert addition(x, y) == z
```

```
$ pytest
```

## **5.1.** Repository structure

- include test data for unit testing if necessary
- create container image from project, preferably docker
- include all necessary dependencies in requirements.txt (locked versions)
- add GitHub actions for testing, linting, building, etc.
- preferable include a devcontainer definition
- README.md and other docs

## **5.1.** Repository structure

```
/repo
 -- .devcontainer
    `-- devcontainer.json
 -- .github
    `-- workflows
      `-- main.yml
 -- .gitignore
 -- Dockerfile
 -- docs
 -- LICENSE
 -- README.md
 -- my_tool.py
 -- my_module
    |-- __init__.py
    |-- my_module.py
    `-- tests
        |-- __init__.py
        `-- my_module_test.py
 -- requirements.txt
 -- test
```

## 5.2. Resources

- pandas
- click
- argparse
- exception handling
- logging
- pytest unittesting
- inpred dockerhub
- devcontainers
